

The plan for the second week of implementation is to implement a class (stats) that will do the math for calculating the average of each data set (e.g average speed). This will include the math for calculating anything needed such as calories burned. If we get this finished on time we will then attempt to have the user have the ability to edit their profile data, such as; name,DOB.

A basic plan for the week after will to create a class or set of classes that will design the graph to view the statistic data of each the runs.
